What do you know about Git?

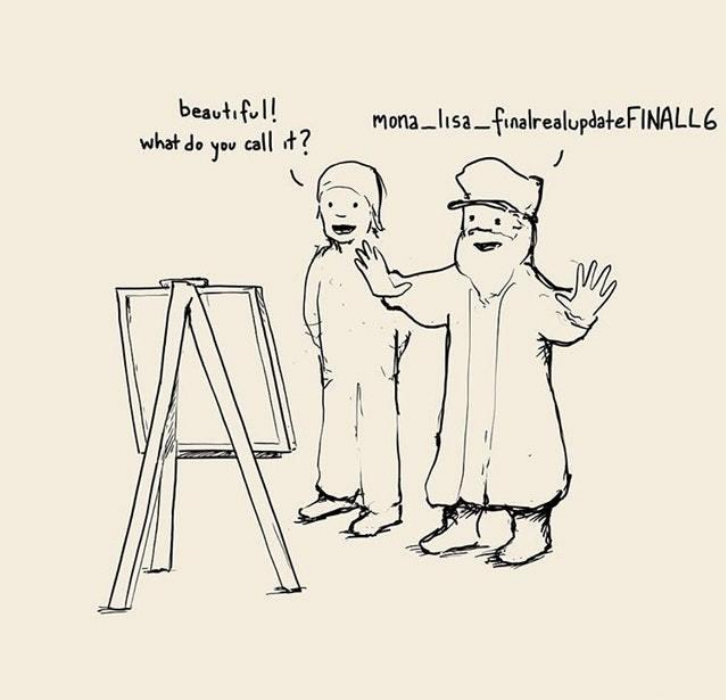
Let’s discuss about Git

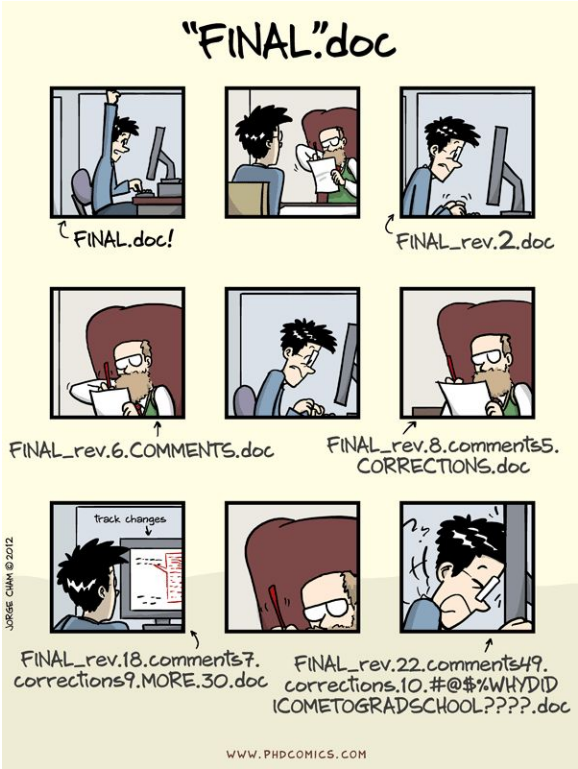
What is Git?

Git is an open source distributed version control system

1 What's Version Control?

What's Version Control?





What's Version Control?

Version Control Systems

What comes to your mind when you hear this?

Students, write your response!

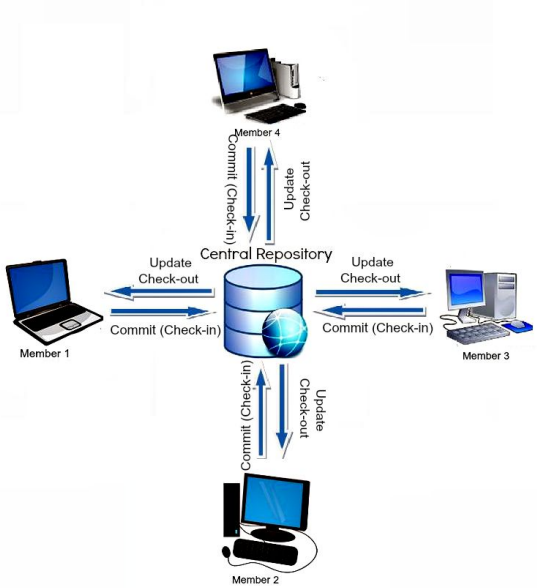
What's Version Control?

- Track changes on text files / source files for you
- Unlimited Undo / Redo
- Time Travel
- Collaborative development environment
- Compare and Blame
  - What changed
  - When it changed
  - Why it changed
  - Who changed it

Version Control Systems

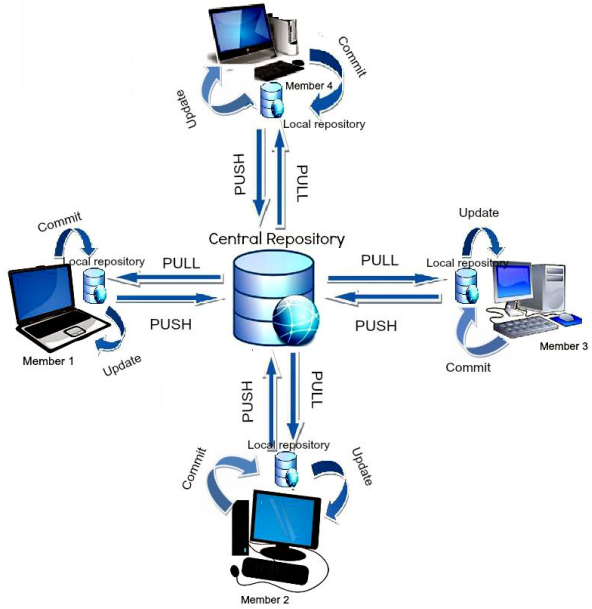
- **Centralized**

You need to be connected to the server



- **Distributed**

You can work while offline

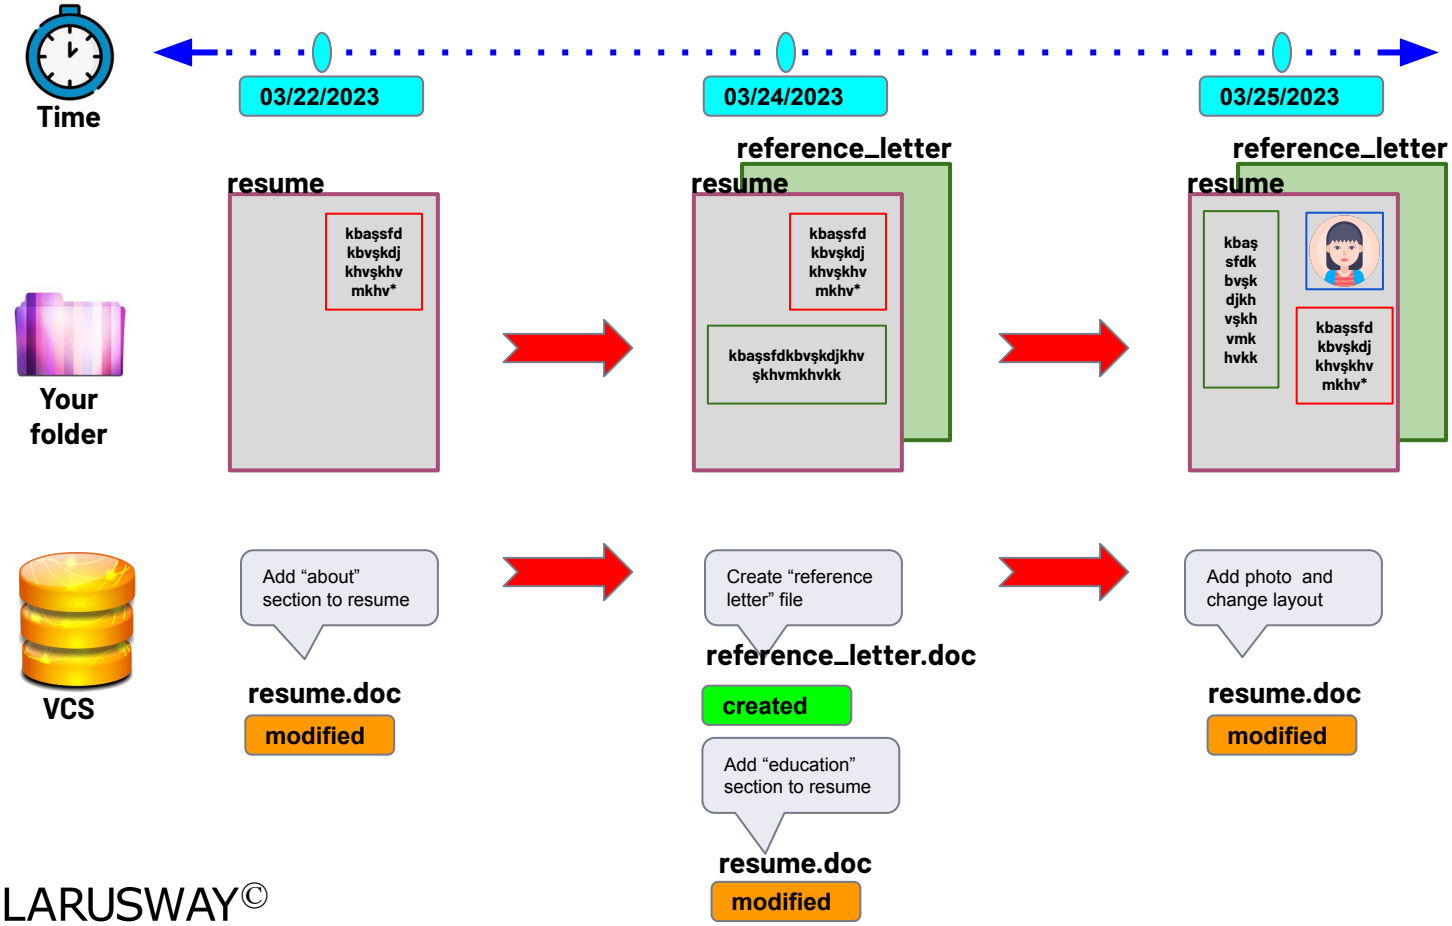


What's Version Control?

Your Daily Tasks

- **Create** things
- **Save** things
- **Edit** things
- Save the things **again**

What's Version Control?



A **version control system** is a system that tracks and records changes to a select group of files over time, so that previous versions of those files can be retrieved easily in the future.

What's Version Control?

Version Control Systems (VCS)

- **Tracks** and **records** changes to files over time

- Can track any type of file, but most commonly used for code
- Contains extra information such as date, author, and a message explaining the change

What's Version Control?

Benefits of Version Control Systems (VCS)

- Can **retrieve** previous version of files at any time
- Retrieve files that were accidentally deleted
- Can be used **locally**, or **collaboratively** with others

2

What is Git?

What is Git?

- **Git** is a software
- Content Tracker
- Distributed Version Control System (VCS)
- Linus Torvalds

Why do we need Git?

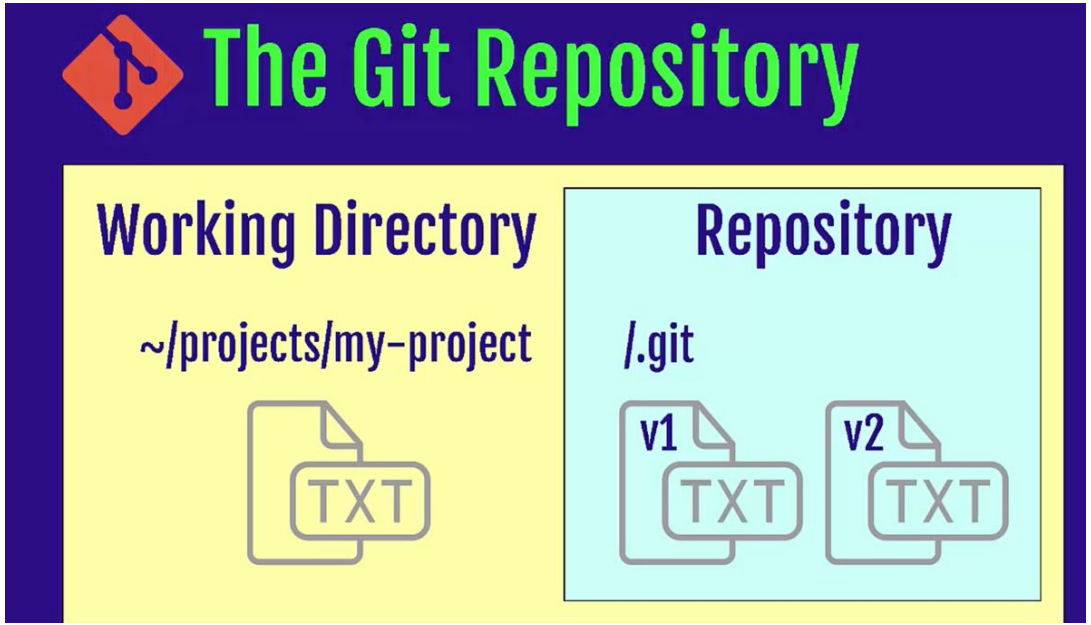
- Backup/Versioning/History
- Undo Changes
- Comparing
- Collaboration and Teamwork
- Code Review

Git Repository

What is a repository

- A directory or storage space where your projects can live.

- Local Repository
- Remote Repository



3 Basic Git Operations

Git Repository

- Let’s check if you have git in your computer

```
git --version
```

- git needs your identity to mark/label changes / editor

```
git config --global user.name “Your Name”
```

```
git config --global user.email “Your Email”
```

```
git config --global core.editor “nano”
```

```
git config --list
```

Git Repository

- to create a new local repo

```
git init
```

- to see the commands

```
git help
```

- to see the status of your repo

```
git status
```

Git Repository

- to create a new remote repo and connect it with your local repo (after you create a remote repo on Github/Bitbucket etc.)

```
git clone address
```

3 Workflow

Workflow

Working Directory

Where you work. Create new files, edit files delete files etc.

Staging Area (Index)

Before taking a snapshot, you're taking the files to a stage. Ready files to be committed.

Repository

Committed snapshots of your project will be stored here with a full version history.

File Stages

Committed	Unmodified changes from the last commit snapshot
Modified	Changes made to files since last commit snapshot
Staged	Changes marked to be added into the next commit snapshot

Track a new file

- let’s create a new file in our project folder

```
touch file1.txt
```

- let’s edit this file

```
nano file1.txt
```

- let’s check the status of our project

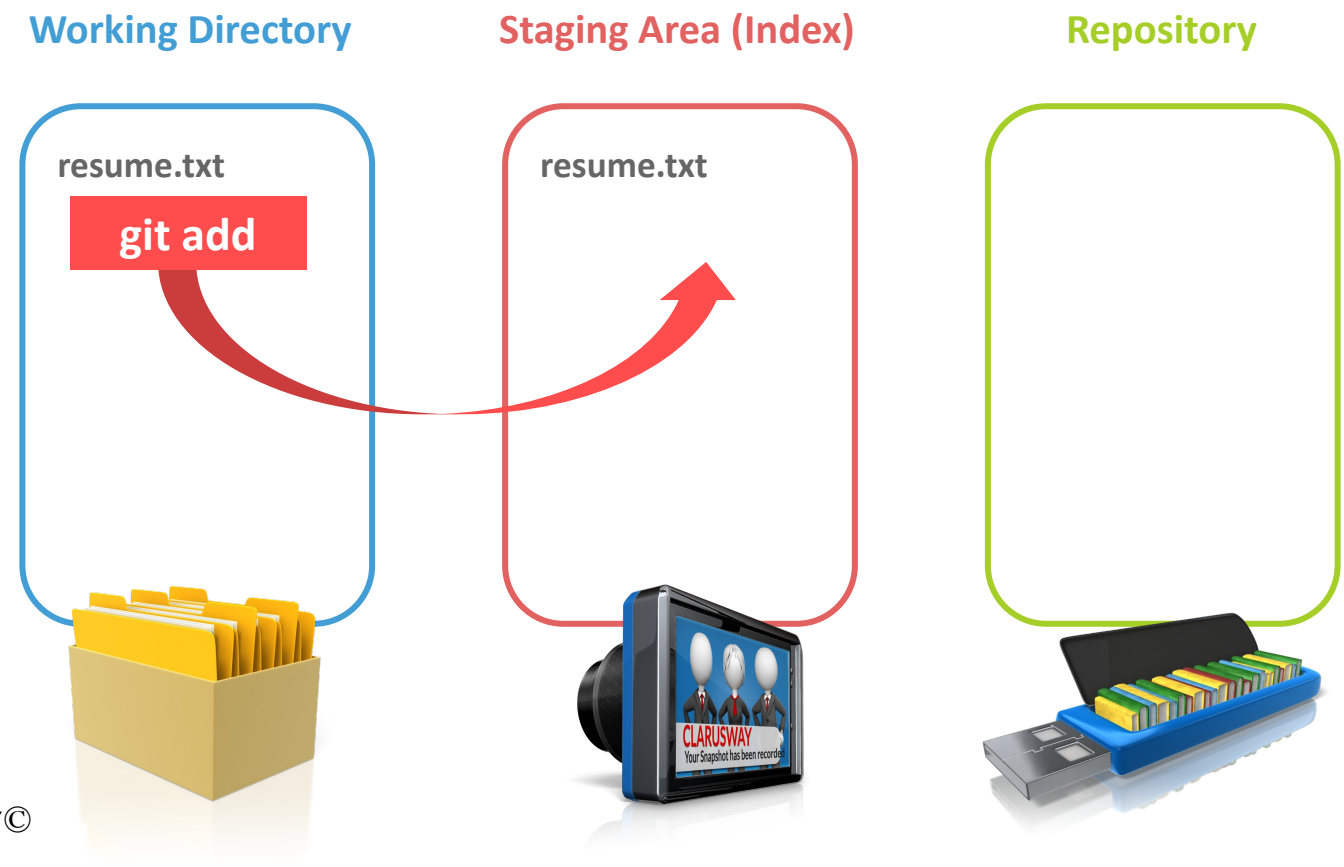
```
git status
```

Stage modified files & commit changes

Create a new file

Working Directory	Staging Area (Index)	Repository
resume.txt untracked file		

Track/stage a file



Stage files options

- stage one file

```
git add filename
```

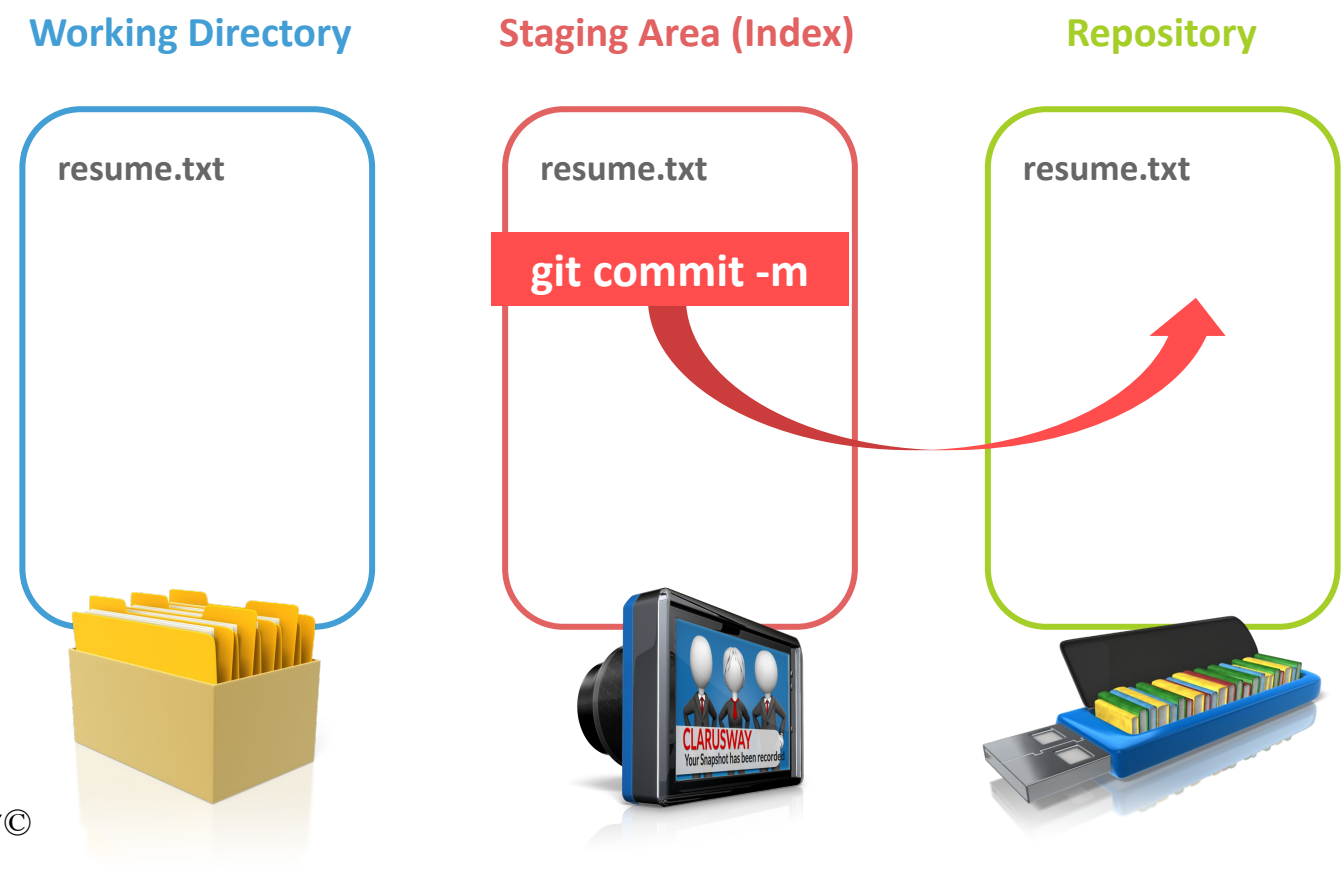
- stage all files (new, modified)

```
git add .
```

- stage modified and deleted files only

```
git add -u
```

Commit



Working Directory
Staging Area (Index)
Repository
resume.txt
resume.txt
git commit -m
resume.txt
CLARUSWAY
Your Snapshot has been recorded

Commit

Working Directory

Staging Area (Index)

Repository

resume.txt

resume.txt

git commit -m

resume.txt

git log

Master

Commit

- Commit the files on the stage

```
git commit -m ”message”
```

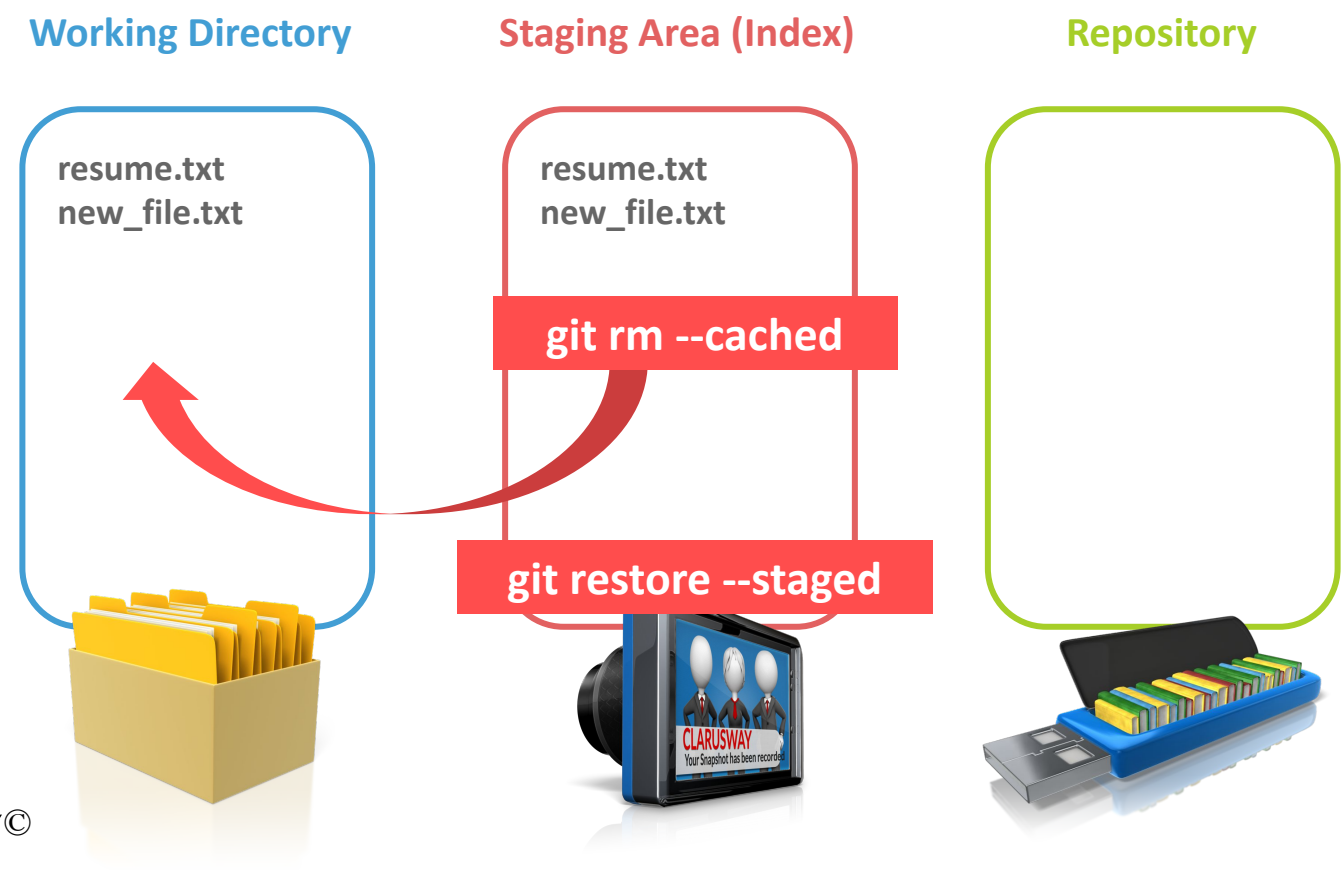
- Add and commit all tracked files

```
git commit -am ”message”
```

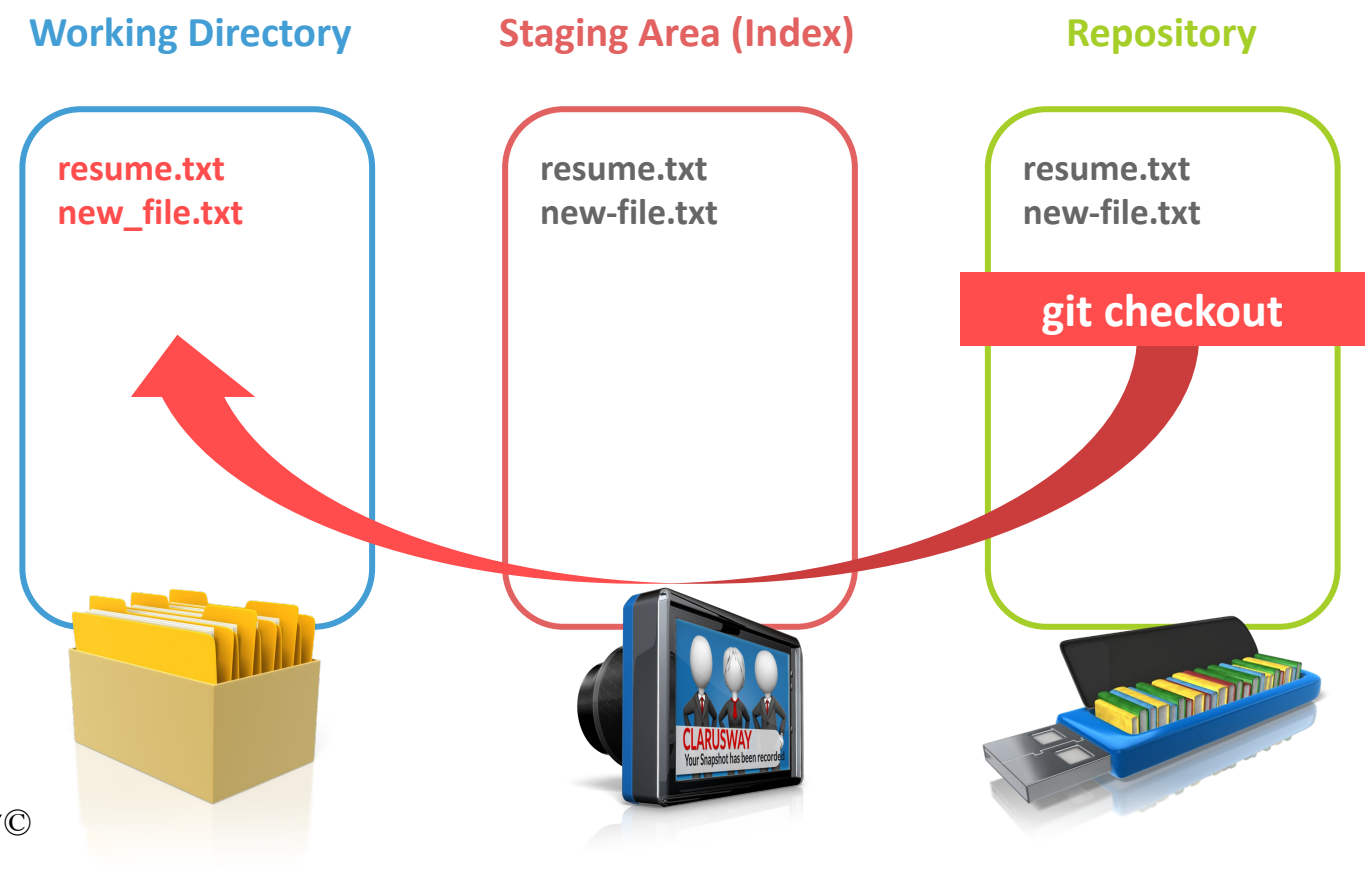
- amend commit message

```
git commit --amend
```

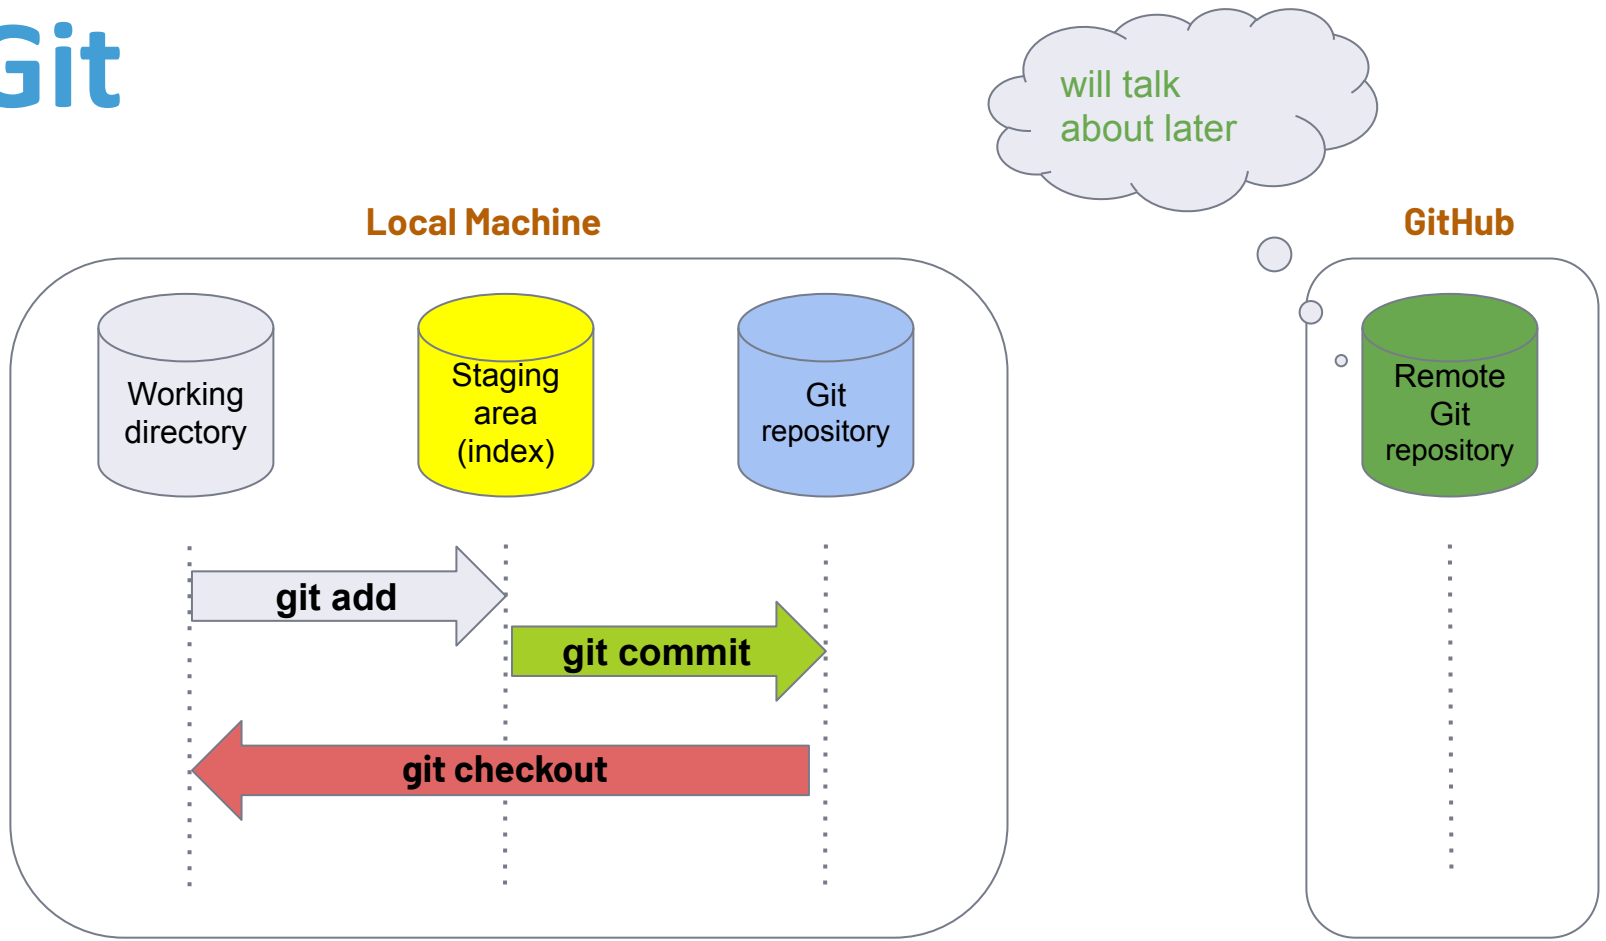
Remove from stage



Checkout from Repo



Git



will talk
about later
Local Machine
GitHub
Working
directory
Staging
area
(index)
Git
repository
Remote
Git
repository
git add
git commit
git checkout

New project

- Create a repo **git init**
- Create a new file/edit file etc.
- Stage/Track your changes **git add .**
- Commit changes **git commit -m “message”**

Kahoot!

Task-1

- Create a new repo under **project-3** folder
- Create a file named **file1.txt**
- Change the file
- Stage the file
- Commit the file to your repo

Students, write your response!

Task-2

- Create a file named **file2.txt**
- Edit **file2.txt**
- Stage
- Delete the file **file1.txt**
- Rename **file2.txt** >> **file3.txt**
- Stage **file3.txt**
- Unstage **file3.txt**
- Stage **file3.txt** again
- Commit the file to your repo
- Change the message of the commit
- Switch back to your first commit in Task-1

Students, write your response!

Summary

Summary

git init

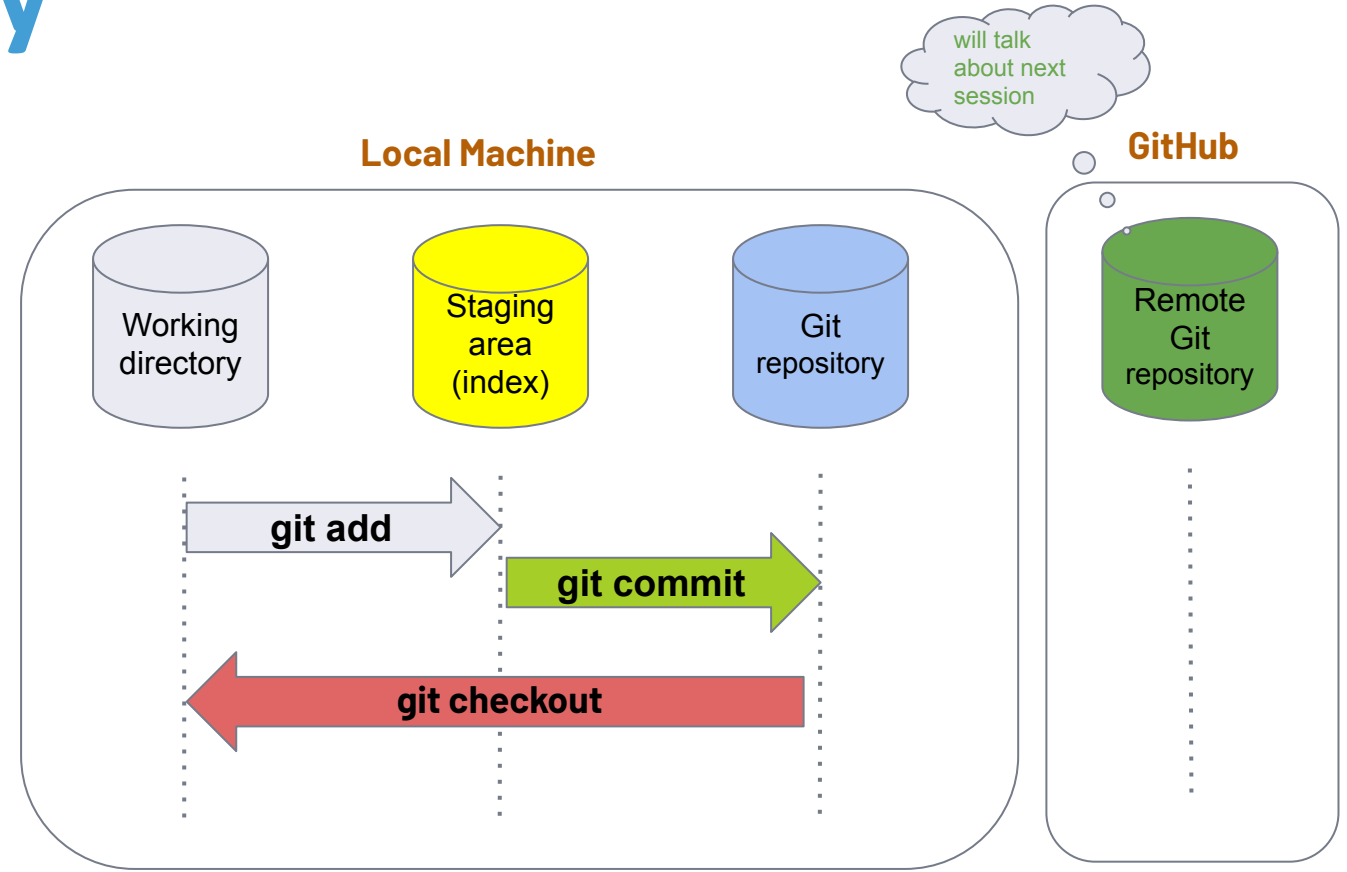
git status

git add .

git commit -m “abc”

git log

git checkout



THANKS!
